

# Splicing ViT Features for Semantic Appearance Transfer

Software & Algorithms

Reference Number: 2192 | Principal Investigator: Prof. Tali Dekel | Patent Status: USA Granted: 12,282,696

An AI algorithm using a pre-trained Vision Transformer (ViT) to transfer one image's appearance onto another's structure, creating realistic chimeric images automatically and efficiently without extra input.

## APPLICATIONS

- A feature for AI systems that can create realistic images with different appearances
- Add-on feature for photo editing software to modify HD photos
- Real-time photo modification tool for social media applications

## DEVELOPMENT STAGE

The ViT algorithm is developed, demonstrated, and published.

## DIFFERENTIATION

Fast and precise image editing

Creation of high-definition, realistic chimeric images

Broad applicability to various objects and scenes
